

Greefa *i*QS

modules

intelligent Quality Sorter

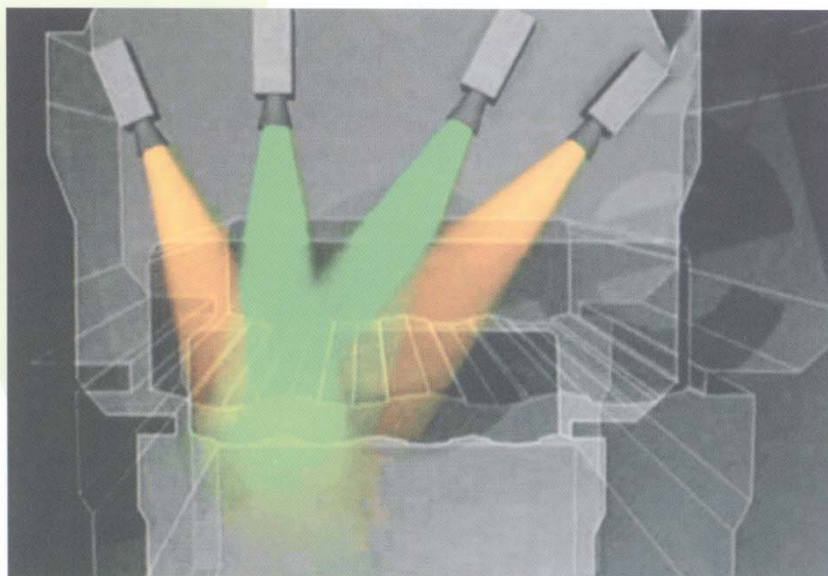

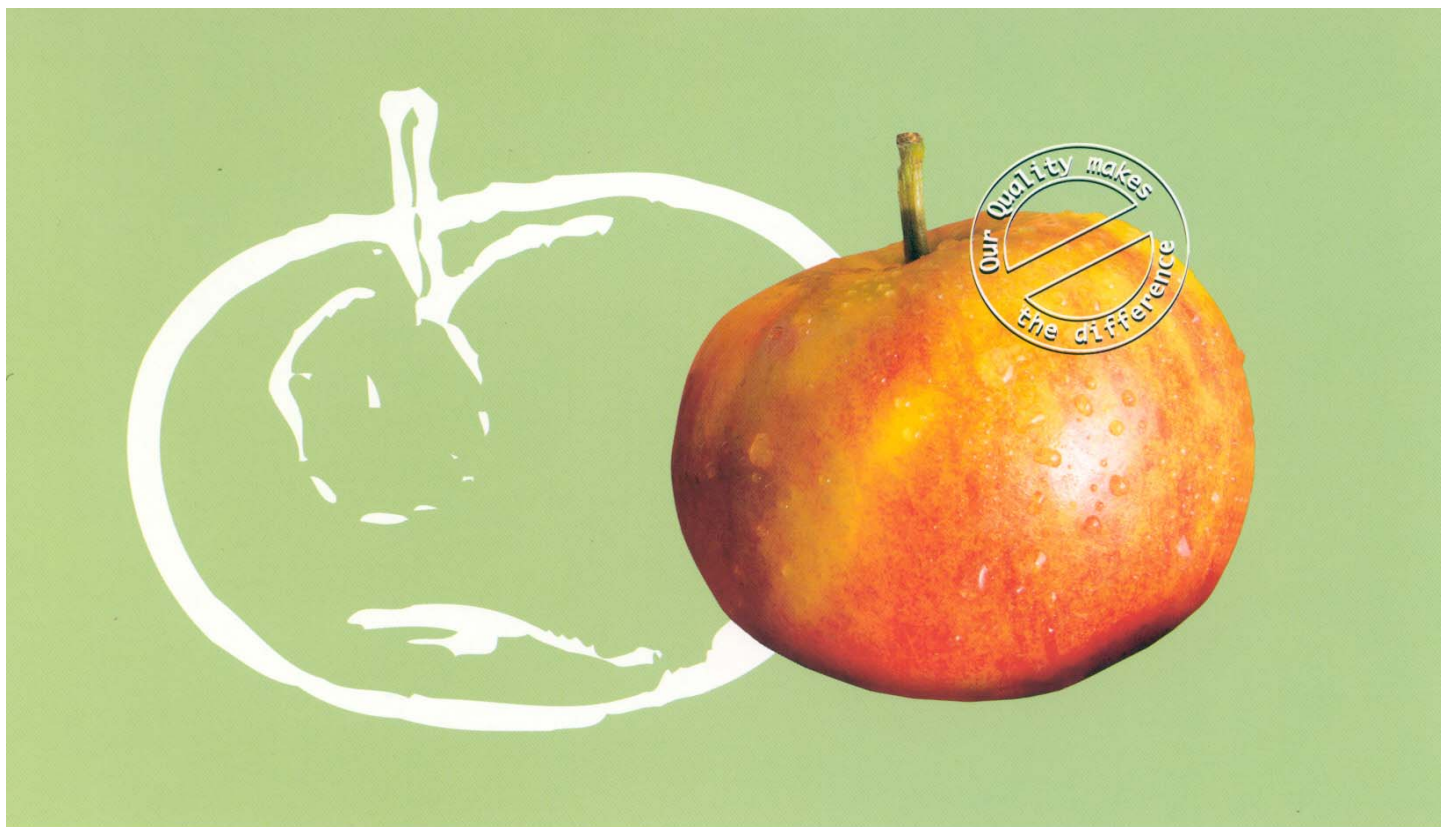

Emotion plays an important role in the sales of fruit and vegetables. Consumers look at the product in shops and markets and often decide whether to buy it on visual grounds. That's why your customers increasingly require products which have been sorted by external characteristics. The second generation of Greefa's intelligent Quality Sorter (*i*QS) allows for such a

sorting procedure. The *i*QS system includes both colour and black-and-white cameras to take up to 70 pictures of the fruit during its passage on the singulator. In the end,

*i*QS provides you with optimum control of the external quality of the fruit; deviations of one square millimetre are detectable. Ever since the introduction of *i*QS in 1996, hundreds of units have been installed all over the world.
